Pin Location(s)	Signal	Pin Type	Description
BW4	USB2_Dp	I/O, Analog	USB 2.0 port data positive.
BY4	USB2_Dn	I/O, Analog	USB 2.0 port data negative.
W53	USB2_DRV_VBUS	O, CMOS	USB OTG requires this signal. It enables 5V to be driven onto VBUS. 0 = Do not drive VBUS. 1 = Drive 5V on VBUS. DRV_VBUS must be connected to an external PMIC chip to provide power for USB VBUS. There is no on-chip power switch for VBUS inside the PHY.
BL13	USB2_ID	I, Analog	USB 2.0 Port OTG ID pin. This pin should be left floating or connected to GND.
BL9	USB2_REXT	I, Analog	USB 2.0 Calibration pad. This pin should be connected to VSS via a 200 ohm resistor.
BL11	USB2_VBUS	I, Analog	USB 2.0 VBUS. This pin is not 5V tolerant and must not connect directly to the 5V VBUS voltage on USB link. This pin must be isolated by an external 30Kohm resistor so it could see a lower voltage.

1. The optimum core supply voltage is determined by the individual chip manufacturing process variation. The system software reads an index stored in the on-chip OTP memory and controls the VDD regulator output voltage. The nominal regulation of the VDD regulator should be within ±3%. For details refer to the *PV Compensation Application Note*.
2. For normal operation only, not applicable during power up/down.
3. The important parameter is maximum junction temperature. The maximum junction temperature needs to be observed in addition to the ambient temperature limits.

Figure 4. SL1680 Recommended power-up sequence in SoC power domain

Note:

1. VDD_CORE starts ramping up (T1) after SoC AVDD1P8 reaches its 100% of 1.8V (T0).
2. MO_AVDD1P8, VDDQ and VDDQLP shall follow the power sequence requirement from the DRAM devices if shared with the DRAM. Otherwise, no specific sequence required between them or relative to other power rails.
3. VDD_CPU and VDD_CORE are recommended to ramp up relatively close to each other. No specific sequence is required between them.
4. No specific sequence is required regarding the SoC 3.3V power rails.
5. No specific sequence is required between SM power rails, or between SM and SoC power rails.
6. Follow the above power sequence requirements when returning from a partially powered-off state such as low-power standby.
